Practica 5: Django Setup

In this homework we are installing a virtual enviorement fot python, after we finished installing this we run a comand as we see in this picture to install Django for python.

) C @ SELECT, INSERT, UPO Install the Dja s is the recommend
marc@Predator-m:-/python
1. Install pip. The easiesi is to use the standardne pip installer, if your os might need to update it if it's outdated. If it's outdated, you'll know because installation won't work 2. Take a look at virtualenv and virtualenverapper. These tools provide isolated Python environments more practical than installing packages systemwide. They also allow installing packages without a privileges. The contributing tutorial walks through how to create a virtualenv. Installing a distribution-specific package

After this line we press Enter and let it install Django. Then we will see something like this:

After this message shows, we can close the terminal and that means we are done.
